

Serial No.: 10/077,501

### AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A system device for sending media session datagrams representing real time streaming media frames to a caller client independent of whether the caller client is served by a network address translation proxy, the system device comprising:

a directory server:

receiving a registration request means for receiving a datagram  
~~originated by the caller client that includes an indicated network address and an~~  
~~indicated port number for receipt of the datagrams representing real time streaming~~  
~~media frames;~~

~~means for extracting a source network address and a source port~~  
~~number from the datagram originated by the client~~  
registration request to identify  
an open signaling channel to the caller client from the directory server that can be  
reverse translated by the network address translation proxy;

receiving a media session signaling request originated by the caller  
client;

obtaining a real time protocol channel from a call control manager;

returning a response signal to the caller client on the open signaling  
channel, the response signal including the real time protocol channel of the call  
control manager; and

the call control manager:

providing the real time protocol channel to the directory server;

receiving a media session datagram from the caller client to the real  
time protocol channel;

extracting a source network address and a source port number from  
the media session datagram to identify an open media channel to the caller client

Serial No.: 10/077,501

from the call control manager that can be reverse translated by the network address translation proxy; and

relaying media session datagrams received from a callee client to the caller client on the open media channel. means for comparing the indicated network address to the source network address;

means for addressing the datagrams representing real time streaming media frames to the source network address and source port number if the indicated network address and the source network address are not the same.

2. (Currently Amended) The system device of claim 1, wherein the directory server further:

writes the extracted source network address and port number to an open signaling channel field of a client database;

periodically receives a UDP datagram comprising a ping message from the caller client; and

updates the network address and port number stored in the open signaling channel field in the client database to reflect a source network address and source port number extracted from the UDP datagram; and

returning the response signal to the caller client on the open signaling channel comprises looking up the network address and port number of the open signaling channel in the client database. further comprising means for addressing the datagrams representing real time streaming media frames to the indicated network address and the indicated port number if the indicated network address and the source network address are the same.

3. (Currently Amended) A system device for sending media session datagrams representing real time streaming frames to a caller client independent of whether the caller client is served by a network address translation proxy, the system device comprising:

a directory server;

Serial No.: 10/077,501

periodically receiving a UDP datagram comprising a ping message from the caller client; means for receiving a session set up datagram originated by the client that includes an indicated network address and an indicated port number for receipt of the datagrams representing real time streaming media frames;

updating an open signaling channel field in a client database to reflect a source network address and a source port number extracted from the UDP datagram;

receiving a media session signaling request originated by the caller client;

obtaining a real time protocol channel from a call control manager;

returning a response signal to the caller client on the open signaling channel field associated with the caller client in the client database, the response signal including the real time protocol channel of the call control manager; and

the call control manager:

providing the real time protocol channel to the directory server;

receiving a media session datagram from the caller client to the real time protocol channel;

means for receiving a session datagram originated by the client that includes a real time streaming media frame;

means for extracting a source network address and a source port number from the session datagram originated by the client; to identify an open media channel to the caller client from the call control manager that can be reverse translated by the network address translation proxy; and

relaying media session datagram received from a callee client to the caller client on the open media channel.

means for comparing the indicated network address to the source network address;

means for addressing the datagrams representing real time streaming media frames to the source network address and source port number if the indicated network address and the source network address are not the same.

Serial No.: 10/077,501

4. (Canceled)

5. (Currently Amended) A system device for sending media session datagrams representing real time streaming frames to a caller client independent of whether the caller client is served by a network address translation proxy, the system device comprising:

a directory server:

receiving a registration request means for receiving a datagram  
~~originated by the caller client that includes an indicated network address and an~~  
~~indicated port number for receipt of the datagrams representing real time streaming~~  
~~media frames;~~

extracting a source network address and a source port number from  
the registration request;

if the extracted source network address matches a client network  
address of the registration request, determining that the caller client is not served  
by a network address translation firewall and recording such determination in a  
client database;

if the extracted source network address is different than a client  
network address of the registration request, determining that the caller client is  
served by a network address translation firewall and recording the extracted source  
network address and source port number in the client database;

receiving a media session signaling request originated by the caller  
client;

obtaining a real time protocol channel from a call control manager;

returning a response signal to the caller client on the open signaling  
channel recorded in the client database, the response signal including:

the real time protocol channel of the call control manager if the  
record in the client database indicates that the caller client is served by a network  
address translation firewall; and

Serial No.: 10/077,501

a real time protocol channel of a callee client identified in the media session signaling request if the record in the client database indicates that the caller client is not served by a network address translation firewall; and

the call control manager;

providing the real time protocol channel of the call control manager to the directory server;

receiving a media session datagram addressed to the real time protocol channel of the call control manager by the caller client;

extracting a source network address and a source port number from the media session datagram to identify an open media channel to the caller client from the call control manager that can be reverse translated by the network address translation proxy; and

relaying media session datagrams received from the callee client to the caller client on the open media channel. ~~means for establishing a destination network address and destination port number for sending the datagrams representing real time streaming media frames to the client, the destination network address and destination port number:~~

~~being the indicated network address and the indicated port number respectively if the indicated network address matches a source network address extracted from the datagram; and~~

~~being a source network address and a source port number extracted from the datagram if the indicated network address does not match the source network address.~~

6. (Currently Amended) A system device for sending media session datagrams representing real time streaming frames to a caller client independent of whether the caller client is served by a network address translation proxy, the system device comprising:

a directory server;

Serial No.: 10/077,501

receiving a registration request means for receiving a session set-up datagram-originated by the caller client that includes an indicated network address and an indicated port number for receipt of the datagrams representing real time streaming media frames;

extracting a source network address and a source port number from the registration request;

if the extracted source network address matches a client network address of the registration request, determining that the caller client is not serviced by a network address translation firewall and recording such determination in a client database;

if the extracted source network address is different than a client network address of the registration request, determining that the caller client is served by a network address translation firewall and recording the extracted source network address and source port number in the client database as an open signaling channel to the caller client;

periodically receiving a UDP datagram comprising a ping message from the caller client;

updating the open signaling channel to the caller client in the client database to reflect a source network address and a source port number extracted from the UDP datagram;

receiving a media session signaling request originated by the caller client;

obtaining a real time protocol channel from a call control manager;

returning a response signal to the caller client on the open signaling channel recorded in the client database, the response signal including:

the real time protocol channel of the call control manager if the record in the client database indicates that the caller client is served by a network address translation firewall; and

Serial No.: 10/077,501

a real time protocol channel of a callee client identified in the media session signaling request if the record in the client database indicates that the caller client is not served by a network address translation firewall; and

the call control manager;

providing the real time protocol channel of the call control manager to the directory server;

receiving a media session datagram addressed to the real time protocol channel of the call control manager by the caller client;

extracting a source network address and a source port number from the media session datagram to identify an open media channel to the caller client from the call control manager that can be reverse translated by the network address translation proxy; and

relaying media session datagrams received from the callee client to the caller client on the open media channel. means for receiving a session datagram originated by the client;

~~means for establishing a destination network address and destination port number for sending the datagrams representing real time streaming media frames to the client, the destination network address and destination port number:~~

~~being the indicated network address and the indicated port number respectively if the indicated network address matches a source network address extracted from the session datagram; and~~

~~being a source network address and a source port number extracted from the datagram if the indicated network address does not match the source network address extracted from the session datagram.~~

7. (Canceled)

8. (Currently Amended) A method for sending media session datagrams representing real time streaming frames to a caller client independent of whether

Serial No.: 10/077,501

the caller client is served by a network address translation proxy, the method comprising:

operating a directory server for:

receiving a registration request datagram originated by the caller client that includes an indicated network address and an indicated port number for receipt of the datagrams representing real time streaming media frames;

extracting a source network address and a source port number from the registration request to identify an open signaling channel to the caller client from the directory server that can be reverse translated by the network address translation proxy; datagram originated by the client;

receiving a media session signaling request originated by the caller client;

obtaining a real time protocol channel from a call control manager;

returning a response signal to the caller client on the open signaling channel, the response signaling including the real time protocol channel of the call control manager; and

operating the call control manager for:

providing the real time protocol channel to the directory server;

receiving a media session datagram from the caller client to the real time protocol channel;

extracting a source network address and a source port number from the media session datagram to identify an open media channel to the caller client from the call control manager that can be reverse translated by the network address translation proxy; and

relaying media session datagrams received from a callee client to the caller client on the open media channel.

comparing the indicated network address to the source network address;

addressing the datagrams representing real time streaming media frames to the source network address and source port number if the indicated network address and the source network address are not the same.

Serial No.: 10/077,501

9. (Currently Amended) The method of claim 8, wherein the directory server further:

writes the extracted source network address and port number to an open signaling channel field of a client database;

periodically receives a UDP datagram comprising a ping message from the caller client; and

updates the network address and port number stored in the open signaling channel field in the client database to reflect a source network address and source port number extracted from the UDP datagram; and

returning the response signal to the caller client on the open signaling channel comprises looking up the network address and port number of the open signaling channel in the client database. ~~further comprising addressing the datagrams representing real time streaming media frames to the indicated network address and the indicated port number if the indicated network address and the source network address are the same.~~

10. (Currently Amended) A method for sending media session datagrams representing real time streaming frames to a caller client independent of whether the caller client is served by a network address translation proxy, the method comprising:

operating a directory server for:

periodically receiving a UDP datagram comprising a ping message from the caller client; ~~session set up datagram originated by the client that includes an indicated network address and an indicated port number for receipt of the datagrams representing real time streaming media frames;~~

updating an open signaling channel field in a client database to reflect a source network address and a source port number extracted from the UDP datagram;

Serial No.: 10/077,501

receiving a media session signaling request originated by the caller client;  
obtaining a real time protocol channel from a call control manager;  
returning a response signal to the caller client on the open signaling channel associated with the caller client in the client database the response signal including the real time protocol channel of the call control manager; and  
operating the call control manager for:  
providing the real time protocol channel to the directory server;  
 receiving a media session datagram originated by the caller client that includes a real time streaming media frame;  
 extracting a source network address and a source port number from the media session datagram originated by the client to identify an open media channel to the caller client from the call control manager that can be reverse translated by the network address translation proxy; and  
relaying media session datagrams received from a callee client to the caller client on the open media channel.  
~~comparing the indicated network address to the source network address;~~  
~~addressing the datagrams representing real time streaming media frames to the source network address and source port number if the indicated network address and the source network address are not the same.~~

11. (Canceled)

12. (Currently Amended) A method for sending media session datagrams representing real time streaming frames to a caller client independent of whether the caller client is served by a network address translation proxy, the method comprising:

operating a directory server for:

Serial No.: 10/077,501

receiving a registration request datagram originated by the caller client that includes an indicated network address and an indicated port number for receipt of the datagrams representing real time streaming media frames;

extracting a source network address and a source port number from the registration request datagram;

if the extracted source network address matches a client network address of the registration request, , determining that the caller client is not served by a network address translation firewall and recording such determination in a client database;

if the extracted source network address is different than a client network address of the registration request, determining that the caller client is served by a network address translation firewall and recording the extracted source network address and source port number in the client database;

receiving a media session signaling request originated by the caller client;

obtaining a real time protocol channel from a call control manager;

returning a response signal to the caller client on the open signaling channel recorded in the client database, the response signal including:

the real time protocol channel of the call control manager if the record in the client database indicates that the caller client is served by a network address translation firewall; and

a real time protocol channel of a callee client identified in the media session signaling request if the record in the client database indicates that the caller client is not served by a network address translation firewall; and

operating the call control manager for:

providing the real time protocol channel of the call control manager to the directory server;

receiving a media session datagram addressed to the real time protocol channel of the call control manager by the caller client;

Serial No.: 10/077,501

extracting a source network address and a source port number from the media session datagram to identify an open media channel to the caller client from the call control manager that can be reverse translated by the network address translation proxy; and

relaying media session datagrams received from the callee client to the caller client on the open media channel. ~~establishing a destination network address and destination port number for sending the datagrams representing real time streaming media frames to the client, the destination network address and destination port number;~~

being the indicated network address and the indicated port number respectively if the indicated network address matches a source network address extracted from the datagram; and

~~being a source network address and a source port number extracted from the datagram if the indicated network address does not match the source network address.~~

13. (Currently Amended) A method for sending media session datagrams representing real time streaming frames to a caller client independent of whether the caller client is served by a network address translation proxy, the method comprising:

operating a directory server for:

receiving a registration request ~~session set-up~~ datagram originated by the caller ~~client~~ that includes an indicated network address and an indicated port number for receipt of the datagrams representing real-time streaming-media frames;

extracting a source network address and a source port number from  
the registration request;

if the extracted source network address matches a client network address of the registration request, determining that the caller client is not

Serial No.: 10/077,501

serviced by a network address translation firewall and recording such determination in a client database;

if the extracted source network address is different than a client network address of the registration request, determining that the caller client is served by a network address translation firewall and recording the extracted source network address and source port number in the client database as an open signaling channel to the caller client;

periodically receiving a UDP datagram comprising a ping message from the caller client;

updating the open signaling channel to the caller client in the client database to reflect a source network address and a source port number extracted from the UDP datagram;

receiving a media session signaling request originated by the caller client;

obtaining a real time protocol channel from a call control manager;

returning a response signal to the caller client on the open signaling channel recorded in the client database, the response signal including:

the real time protocol channel of the call control manager if the record in the client database indicates that the caller client is served by a network address translation firewall; and

a real time protocol channel of a callee client identified in the media session signaling request if the record in the client database indicates that the caller client is not served by a network address translation firewall; and

operating the call control manager for:

providing the real time protocol channel of the call control manager to the directory server;

receiving a media session datagram addressed to the real time protocol channel of the call control manager by the caller client;

extracting a source network address and a source port number from the media session datagram to identify an open media channel to the caller client

Serial No.: 10/077,501

from the call control manager that can be reverse translated by the network address translation proxy; and

relaying media session datagrams received from the callee client to the caller client on the open media channel. ~~receiving a session datagram originated by the client;~~

~~establishing a destination network address and destination port number for sending the datagrams representing real-time streaming media frames to the client, the destination network address and destination port number:~~

~~being the indicated network address and the indicated port number respectively if the indicated network address matches a source network address extracted from the session datagram; and~~

~~being a source network address and a source port number extracted from the datagram if the indicated network address does not match the source network address extracted from the session datagram.~~

14. (Canceled)

15. (New) The system of claim 5, wherein, if the extracted source network address is different than a client network address of the registration request, the directory server further:

writes the extracted source network address and port number to an open signaling channel field of a client database;

periodically receives a UDP datagram comprising a ping message from the caller client; and

updates the network address and port number stored in the open signaling channel field in the client database to reflect a source network address and source port number extracted from the UDP datagram; and

returning the response signal to the caller client on the open signaling channel comprises looking up the network address and port number of the open signaling channel in the client database.

Serial No.: 10/077,501

16. (New) The method of claim 12, wherein, if the extracted source network address is different than a client network address of the registration request, the directory server further:

- writes the extracted source network address and port number to an open signaling channel field of a client database;

- periodically receives a UDP datagram comprising a ping message from the caller client; and

- updates the network address and port number stored in the open signaling channel field in the client database to reflect a source network address and source port number extracted from the UDP datagram; and

- returning the response signal to the caller client on the open signaling channel comprises looking up the network address and port number of the open signaling channel in the client database.
